

Strategic Recommendations & Presentation Script

Formula 1 World Championship (1950–2020) Power BI Project

1. Strategic Recommendations

Recommendation	Reasoning	Expected Benefit	Priority	Implementation Difficulty
Target circuits where the points pivot table shows the largest gap versus top constructors	The Points by circuit vs Top Constructors pivot table shows meaningful variation in points by circuit and constructor; concentrating aerodynamic development on the circuits where a team trails most closely could yield the highest marginal points return.	Increased likelihood of top-six finishes at the identified circuits.	High	Medium
Prioritise sub-two-second pit stop execution	The Total Pit Stops by driver chart shows high career pit stop volumes for modern-era drivers†, indicating that operational pit speed has a direct bearing on track position in multi-stop eras.	Direct gain of 1–3 seconds of track position per race without additional engine development cost.	High	Low
Align R&D cycles with regulatory reset years	The Points Trend by top 5 Constructors chart shows constructor dominance periods (e.g., Ferrari early 2000s, Mercedes 2014–2020) beginning close to the start of major rule changes.	Sustained multi-year competitive advantage from allocating capital ahead of regulatory shifts.	High	High
Expand regional driver academy investment	The Total Points by Country map shows points generation concentrated in a small number of countries, historically led by Western Europe†; expanding scouting	Broader sponsorship reach and earlier access to talent from under-represented regions.	Medium	Medium

Recommendation	Reasoning	Expected Benefit	Priority	Implementation Difficulty
	elsewhere could unlock untapped talent pools.			
Standardise the data pipeline ahead of any live-telemetry expansion	Building this report highlighted the value of a clean star schema (DimDriver, DimConstructor, DimCircuit, DimDate) for reliable reporting; extending this structure would ease any future move to real-time data.	Faster strategy modelling and more reliable reporting as new data sources are added.	Medium	Low

2. Presentation Script

Title & Executive Context

"Today we are walking through a business intelligence report evaluating Formula 1 World Championship performance data from 1950 through 2020. Using Power BI, we modelled Grand Prix race results, constructor and driver performance, pit stop activity, and championship points into an interactive dashboard. Our goal is to examine what separates temporary winning streaks from sustained dominance, how circuit and country-level results vary, and where operational execution — particularly pit stops — has the most influence on outcomes."

Driver Performance

"Looking first at overall driver performance: the Win Distribution by Driver treemap shows career victories heavily concentrated among a small group of elite drivers. Lewis Hamilton and Michael Schumacher lead overall career wins by a clear margin†. The Wins Trend by top 5 Drivers chart shows that these wins are not spread evenly across each driver's career — they cluster within specific multi-year windows, most visibly for Hamilton from 2014 onward and for Schumacher in the early 2000s. Top driver success tracks closely with periods of constructor engineering stability."

Constructor Analysis

"Scuderia Ferrari holds the highest overall historical win total, reflecting continuous participation since 1950. But the Points Trend by top 5 Constructors chart tells a different story for recent seasons: Mercedes' points output rises sharply within a much shorter, seven-season window from 2014 to 2020, compared with the longer, steadier accumulation shown by historical constructors such as McLaren and Williams. This suggests that centralised,

proprietary power-unit development can produce faster, steeper dominance curves than were typical in earlier decades."

Circuit and Points Comparison

"A key question for strategy directors is where the gap between top constructors and the midfield is widest. The Points by circuit vs Top Constructors pivot table lets us compare points totals circuit by circuit and constructor by constructor. It does not currently produce a single headline gap percentage, so rather than quote one figure for every power circuit, teams should use the pivot table directly to identify the specific circuits where they trail top constructors most, and target development there."

Operational Pit Strategy & Geographic Distribution

"Drivers in the modern era show noticeably higher career pit stop volumes than drivers from earlier decades, as seen in the Total Pit Stops by driver chart†. This lines up with two regulatory changes: the introduction of mandatory multi-compound tyres in the Pirelli era after 2011, and the removal of in-race refuelling after 2009. Operational pit execution is therefore a real strategic lever, not just a maintenance event. On the Total Points by Country map, historic points generation remains concentrated in a small number of countries, led by Western Europe†, which points to expanding driver academies into under-represented regions as a growth opportunity."

Recommendations & Closing

"In summary, three priorities follow directly from the dashboard: first, align R&D investment with regulatory transition years, where sustained dominance has historically taken hold. Second, use the circuit-level pivot table — not a single industry-wide figure — to target aerodynamic development where it will help most. Third, continue investing in pit crew execution, where sub-two-second stops deliver a measurable, low-cost gain in track position. Thank you, and I welcome any questions."
